## 1.1 Linux Process Status

Status	Type
R Ready or running	TASK_RUNNING(R)
D Uninterruptible sleep (usually IO)	TASK_UNINTERRUPTIBLE(D)
S Interruptible sleep (waiting for an event to complete)	TASK_INTERRUPTIBLE(S)
Z defunct/zombie, terminated but not cleaned up by its parent	TASK_ZOMBIE(Z)
T Execution stopped	TASK_STOPPED(T)
Processes contribute to CPU load	R, D

## 1.2 Find process

Name	Comment
Sort processes by ram usage	<code>ps -eo size,pid,user,pcpu,command --sort -rss</code>
Sort processes by cpu usage	<code>ps -eo size,pid,user,pcpu,command --sort -pcpu</code>
Get parent process id by pid	<code>ps -o ppid= -p &lt;pid&gt;</code>
Find process by name	<code>pgrep &lt;process_name&gt;</code>
List zombie processes	See zombie-process.sh
List all process	<code>ps aux, ps axjf</code>

## 1.3 Top Command

Name	Comment
Top show process full command line	Use <code>c</code> to toggle
Top sort process by memory usage	<code>Shift+m</code>
Top for certain processes	<code>top -p 'pgrep -d "," java'</code>

## 1.4 Examine process

Name	Comment
Trace system calls and signals by pid	<code>strace -p &lt;pid&gt;</code>
List all file handlers by pid	<code>lsof -p &lt;pid&gt;</code>
Display process tree by pid	<code>pstree -A -n -p &lt;pid&gt;</code>
List all listening ports by pid	See proc-listen-ports.sh
Get process ram usage by pid	<code>sudo pmap -x &lt;pid&gt;</code>

## 1.5 Kill process

Name	Comment
Kill process gracefully	<code>kill &lt;pid&gt;, kill -15 &lt;pid&gt;, kill -TERM &lt;pid&gt;</code>
Kill process by force	<code>kill -9 &lt;pid&gt;, kill -KILL &lt;pid&gt;</code>
kill process by its full process name	<code>pkill &lt;processname&gt;</code>
kill process by it's partial name	<code>pkill -f &lt;process-string&gt;</code>
Kill process by process name	<code>killall &lt;process_name&gt;</code>

## 1.6 Explore /proc filesystem

Name	Comment
Check process start command	<code>cat /proc/\$pid/cmdline</code>
Check process environment variables	<code>cat /proc/\$pid/environ</code>
Check process ulimits setting	<code>cat /proc/\$pid/limits</code>
Check cpu utilization	<code>/proc/loadavg</code>
List all partitions	<code>/proc/partitions</code>
List all modules	<code>/proc/modules</code>
List TCP/UDP packages	<code>sudo cat /proc/\$PID/net/nf_conntrack</code>
Get current IP from /proc	See <code>proc-get-ip.sh</code>
