1.1 uaac

Name	Command
Run command	uaac apt-install ruby ruby-dev build-essential rubygems; gem install uaac-cf
Set a new target	uaac target https:// <uaa-dnsname>:8443skip-ssl-validation</uaa-dnsname>
List all context	uaac contexts
Log in as a UAA admin	uaac token client get admin -s <uaa-management-admin-client> Link: Log in as a UAA Adm</uaa-management-admin-client>
List users	uaac users
List all client registrations	uaac clients
Add user	uaac user add alanaemails alana@example.com -p password Link: Grant PKS Access to a
Add user to group	uaac member add pks.clusters.admin alana Link: Grant PKS Access to a User
Get specific user account	uaac user get alana
Get user	uaac user get pks-admin

Tokens
  token get [credentials...]
                                   Gets a token by posting user credentials with an implicit grant request
                                   -c | --client <name>
                                   --scope <list>
  token client get [id]
                                   Gets a token with client credentials grant
                                   -s | --secret <secret>, client secret
                                   --scope <list>
  token owner get [client] [user]
                                   Gets a token with a resource owner password grant
                                   -s | --secret <secret>, client secret
                                   -p | --password <password>, user password
                                   --scope <list>
  token sso get [client]
                                   Gets a token based on a one time passcode after successful SSO via browser
                                   -s | --secret <secret>, client secret
                                   --passcode <passcode>
                                   --scope <list>
  token refresh [refreshtoken]
                                   Gets a new access token from a refresh token
                                   -c | --client <name>
                                   -s | --secret <secret>, client secret
                                   --scope <list>
  token authcode get
                                   Gets a token using the authcode flow with browser
                                   -c | --client <name>
                                   -s | --secret <secret>, client secret
                                   --scope <list>
                                   --[no-]cf, save token in the ~/.cf_tokens file
                                   --port <number>, pin internal server to specific port
  token implicit get
                                   Gets a token using the implicit flow with browser
                                   -c | --client <name>
                                   --scope <list>
                                   --[no-]cf, save token in the ~/.cf_tokens file
                                   --port <number>, pin internal server to specific port
  token decode [token] [tokentype] Show token contents as parsed locally or by the UAA. Decodes locally unles
                                   --key <key>, Token validation key
                                   -c | --client <name>
                                   -s | --secret <secret>, client secret
  token delete [contexts...]
                                   Delete current or specified context tokens and settings
                                   --[no-]all, remove all contexts
User Accounts
  users [filter]
                                   List user accounts
                                   -a | --attributes <names>, output for each user
                                   --start <number>, start of output page
                                   --count <number>, max number per page
  user get [name]
                                   Get specific user account
                                   --origin <identity provider origin, defaults to UAA>
                                   -a | --attributes <names>, output for each user
```

Updated: November 26, 2019

```
user add [name]
                                   Add a user account
                                   --given_name <name>
                                   --family_name <name>
                                   --emails <addresses>
                                   --phones <phone_numbers>
                                   --origin <identity provider origin, defaults to UAA>
                                   -p | --password <password>, user password
  user update [name]
                                   Update a user account with specified options
                                   --given_name <name>
                                   --family_name <name>
                                   --emails <addresses>
                                   --phones <phone_numbers>
                                   --origin <identity provider origin, defaults to UAA>
                                   --del_attrs <attr_names>, list of attributes to delete
 user delete [name]
                                   Delete user account
                                   --origin <identity provider origin, defaults to UAA>
  user ids [username|id...]
                                   Gets user names and ids for the given users
  user unlock [name]
                                   Unlocks the user account
  user deactivate [name]
                                   Deactivates user
  user activate [name]
                                   Activates user
  password set [name]
                                   Set password
                                   -p | --password <password>, user password
                                   Change password for authenticated user in current context
  password change
                                   -o | --old_password <password>, current password
                                   -p | --password <password>, user password
Groups
  groups [filter]
                                   List groups
                                   -a | --attributes <names>, output for each user
                                   --start <start>, show results starting at this index
                                   --count <count>, number of results to show
  group get [name]
                                   Get specific group information
                                   -a | --attributes <names>, output for each user
  group add [name]
                                   Adds a group
  group delete [name]
                                   Delete group
  group mappings
                                   List all the mappings between uaa scopes and external groups
                                   --start <start>, show results starting at this index
                                   --count <count>, number of results to show
  group map [external_group]
                                   Map uaa groups to external groups
                                   --id <id>, map uaa group using group id
                                   --name <name>, map uaa scope using group name
                                   --origin <origin>, map uaa scope to external group for this origin. Defaul
  group unmap [group_name] [external_group]
                                   Unmaps an external group from a uaa group
                                   --origin <origin>, map uaa scope to external group for this origin. Defaul
  member add [name] [users...]
                                   add members to a group
  member delete [name] [users...]
                                   remove members from a group
Client Application Registrations
  clients [filter]
                                   List client registrations
                                   -a | --attributes <names>, output for each user
                                   --start <start>, show results starting at this index
                                   --count <count>, number of results to show
  client get [id]
                                   Get specific client registration
                                   -a | --attributes <names>, output for each user
  client add [id]
                                   Add client registration
                                   --name <string>
                                   --scope <list>
                                   --authorized_grant_types <list>
```

                                    --access_token_validity <seconds>
                                    --refresh_token_validity <seconds>
                                    --redirect_uri <list>
                                    --autoapprove <list>
                                    --signup_redirect_url <url>
                                    --del_attrs <attr_names>, list of attributes to delete
                                   -i | --[no-]interactive, interactively verify all values
  client delete [id]
                                   Delete client registration
  secret set [id]
                                   Set client secret
                                   -s | --secret <secret>, client secret
  secret change
                                   Change secret for authenticated client in current context
                                    --old_secret <secret>, current secret
                                   -s | --secret <secret>, client secret
CURL
  curl [path]
                                   CURL to a UAA endpoint
                                   -X | --request <method>, request method type, defaults to GET
                                   -d | --data <data>, data included in request body
                                    -H | --header <header>, header to be included in the request
                                   -k | --insecure, makes request without verifying SSL certificates
Global options:
  -h | --[no-]help
                                   display helpful information
  -v | --[no-]version
                                   show version
  -d | --[no-]debug
                                   display debug information
  -t | --[no-]trace
                                   display extra verbose debug information
  --config [string|file]
                                   file to get/save configuration information or yaml string
  -z | --zone <subdomain>
                                   subdomain of zone to manage
```
